

Structure of Mg Isotope Studied by β -Decay Spectroscopy of Spin-Polarized Na Isotopes - Shape Coexistence in ^{30}Mg -

A. Odahara, **K. Tajiri** and T. Shimoda
Department of Physics, Osaka University
in collaboration with
KEK, TRIUMF, Univ. Paris and IPN Orsay

study for the nuclear structure of neutron-rich nuclei
in the vicinity of **island of inversion** ^{28}Mg , ^{29}Mg , **^{30}Mg**

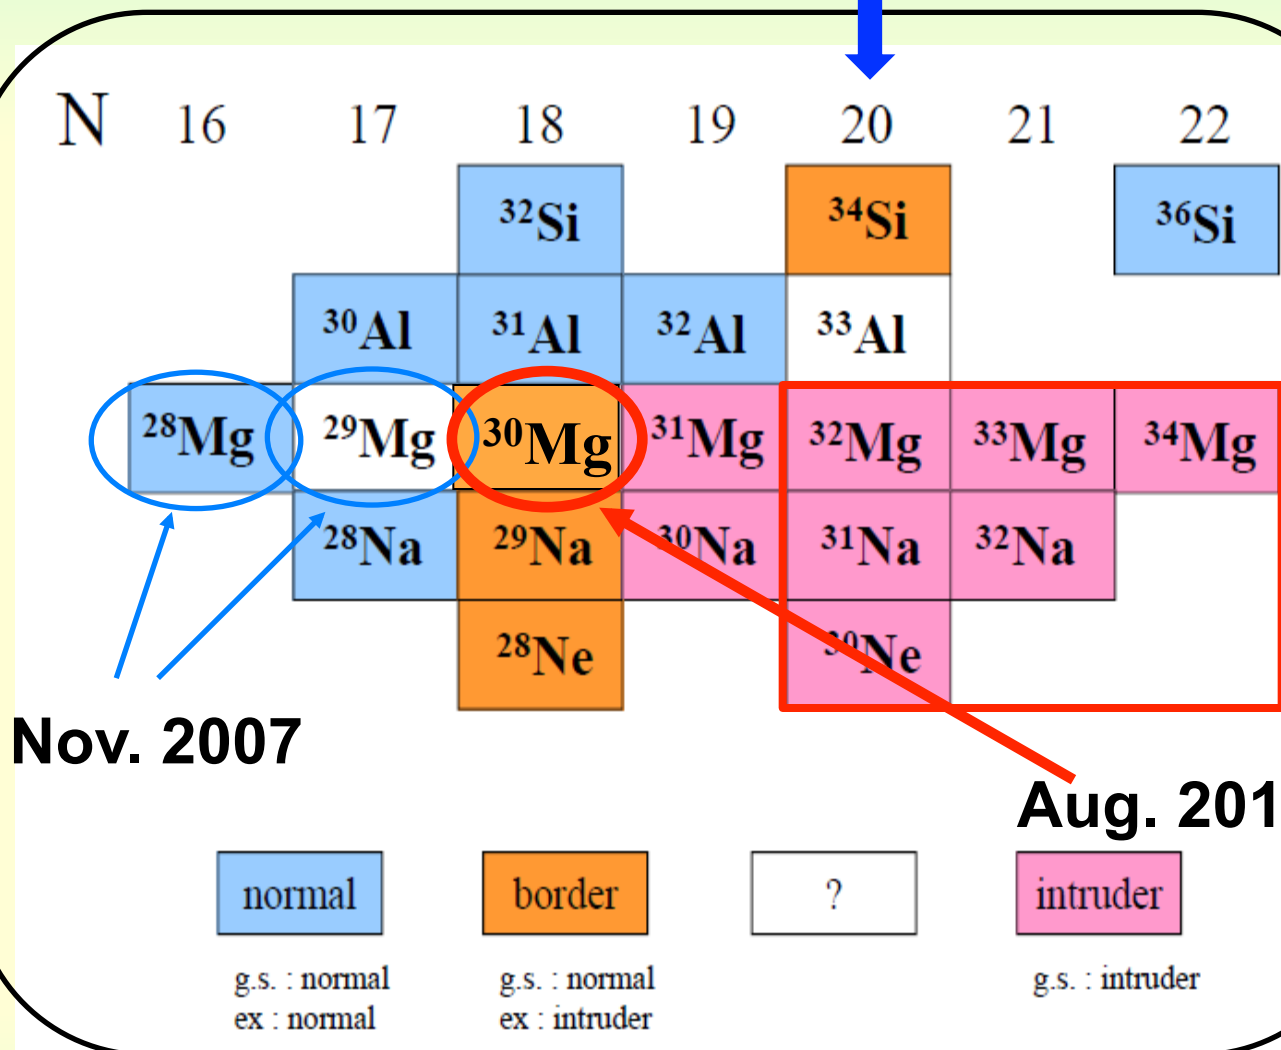

shell evolution as a function of neutron number

new method by the β decay of the **spin-polarized Na isotopes**
can determine the spin-parity of levels.

1. introduction

magic number?

Island of inversion

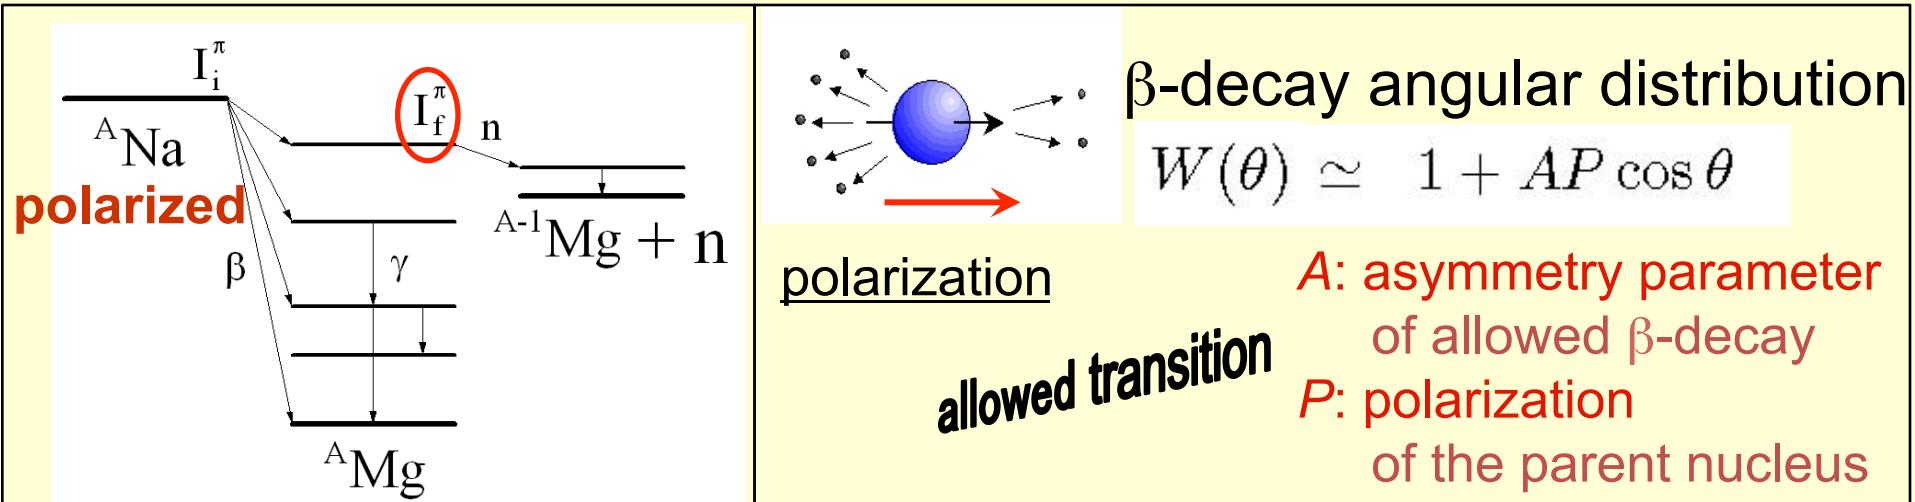

E.K. Warburton et al.,
Phys. Rev. C 41 (1990) 1147

Which level has the intruder configuration?
How does shell structure evolve with N ?

2. new method to assign spin-parity using spin-polarized beam

β -decay spectroscopy using spin-polarized beam

very effective method to assign spin-parity of daughter states

initial \rightarrow I_i **final** \rightarrow I_f

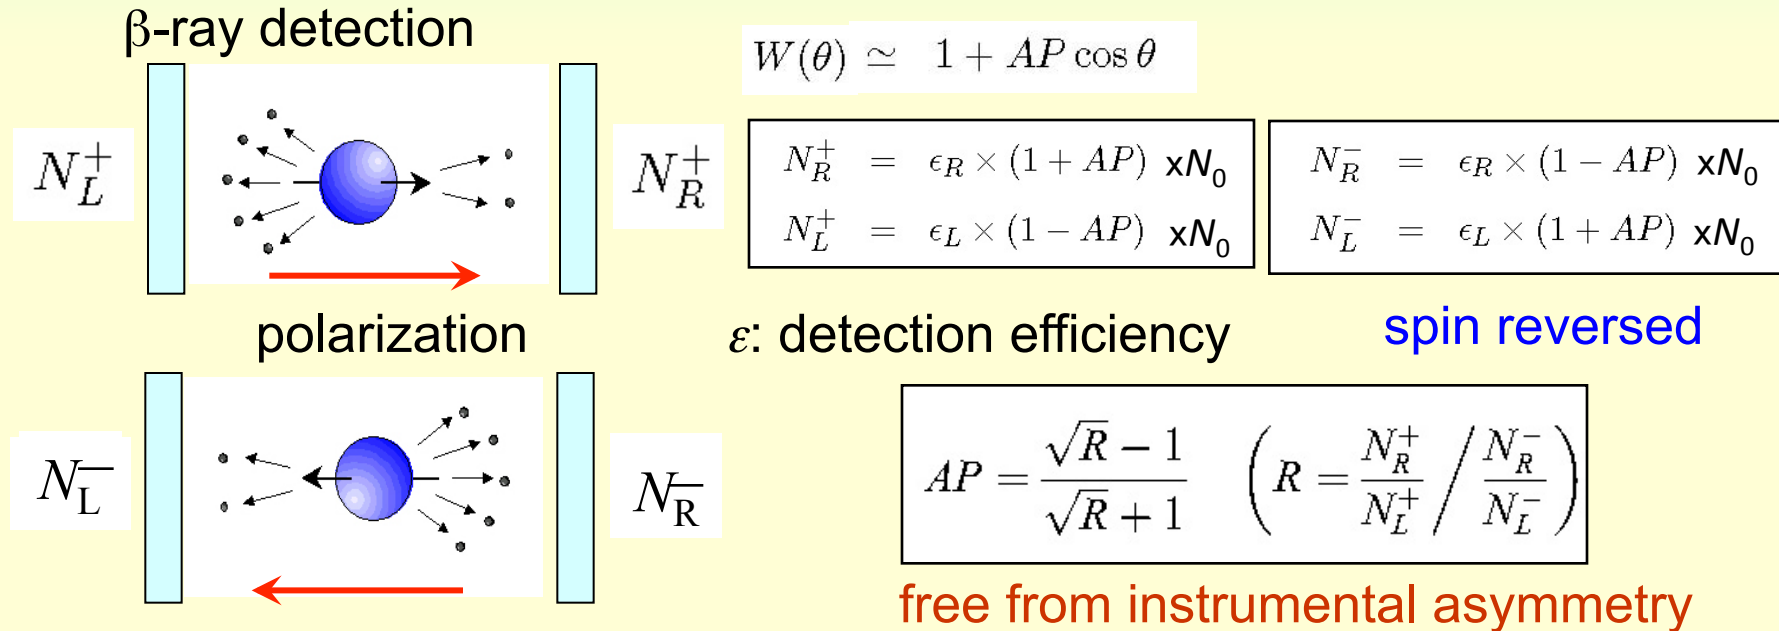

$$A(I_i, I_f) \begin{cases} = \frac{I_i}{I_i + 1} & (\text{for } I_f = I_i + 1) \\ \simeq \frac{-1}{I_i + 1} & (\text{for } I_f = I_i) \\ = -1 & (\text{for } I_f = I_i - 1) \end{cases} \quad \text{assume pure GT}$$

A takes very different values depending on the final state spin.

	I_i^π (Na)	I_f^π (Mg)	$A(I_i, I_f)$
^{28}Na	1^+	2^+	+0.5
		1^+	-0.5
		0^+	-1.0
$^{29,31}\text{Na}$	$3/2^+$	$5/2^+$	+0.6
		$3/2^+$	-0.4
		$1/2^+$	-1.0
^{30}Na	2^+	3^+	+0.67
		2^+	-0.33
		1^+	-1.0

2. new method to assign spin-parity using spin-polarized beam

(1) how to deduce AP value

(2) how to determine spin

P can be evaluated from AP value for a transition to the known spin state.

$A \rightarrow$ spin assignment

9 HPGe detectors + plastic
scintillator telescopes

β -asymmetry: β - γ , β - γ - γ , γ - γ

3. experiment

^{30}Na decay at TRIUMF

total efficiency
2.5% @1333keV

^{28}Na and ^{29}Na in Nov. 2007
 ^{30}Na in Aug. 2010

β energy threshold: eliminates Al contaminants
from trigger

β energy : assigns β -decay branch

**New findings
are in red.**

**14 γ rays &
4 energy levels
Spins & parities
of 10 levels**

4. results (2) polarization and spin (2-1) deduced AP values for 2 levels

$$W(\theta) \simeq 1 + AP \cos \theta$$

$$AP = \frac{\sqrt{R} - 1}{\sqrt{R} + 1} \quad \left(R = \frac{N_L^+}{N_R^+} \bigg/ \frac{N_L^-}{N_R^-} \right)$$

polarization

5022 keV γ ray depopulating
the 5.022MeV level

Energy [keV]

$$A_{5.022}P = 0.38 \pm 0.06$$

4967 keV γ ray depopulating
the 4.967MeV level

Energy [keV]

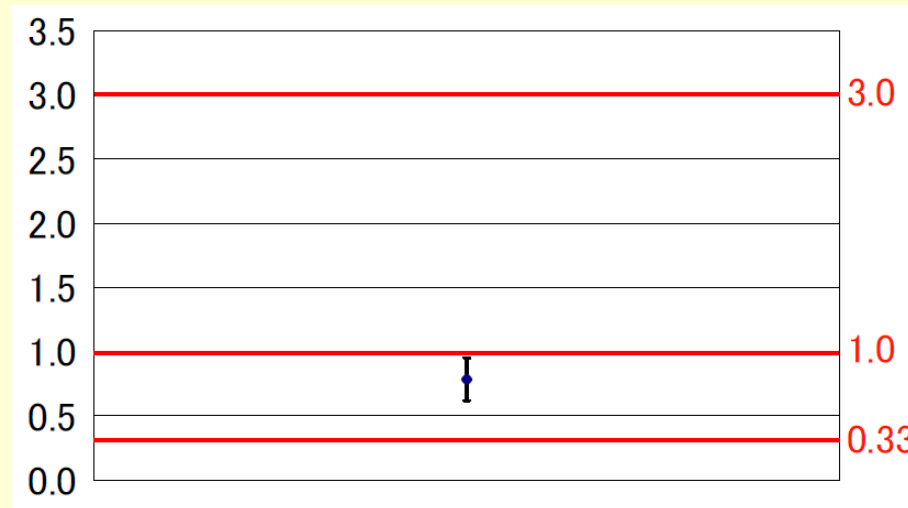

$$A_{4.967}P = 0.29 \pm 0.04$$

4. results (2) polarization and spin (2-2) spin assignment from the deduced AP value

AP ratio $\frac{A_{4.967}P}{A_{5.022}P} = \frac{A_{4.967}}{A_{5.022}} = 0.76 \pm 0.16$

Spins & parities of these 2 levels were reported to be $(1, 2)^+$.

I^π	A
1^+	-0.33
2^+	-1.0

$$\frac{A_{2+}}{A_{1+}} = 3$$

$$\frac{A_{2+}}{A_{2+}} \text{ or } \frac{A_{1+}}{A_{1+}} = 1$$

$$\frac{A_{1+}}{A_{2+}} = 0.33$$

A/A : 4 patterns

$$\frac{I^\pi_{4.967}}{I^\pi_{5.022}} = \frac{1^+}{1^+} \text{ or } \frac{2^+}{2^+}$$

Which is appropriate ?

4. results (2) polarization and spin (2-3) deduced polarization P and determined spin

Which is appropriate ?

$$\frac{I^{\pi}_{4.967}}{I^{\pi}_{5.022}} = \frac{1^{+}}{1^{+}} \text{ or } \frac{2^{+}}{2^{+}}$$

Evaluation of spins & parities
by calculating Polarization P

$$A_{5.022} P = 0.38 \pm 0.06$$

$$A_{4.967} P = 0.29 \pm 0.04$$

Polarization of ^{30}Na
 $32 \pm 3 \%$

$$A_{5.022} = -0.33$$

$$A_{4.967} = -0.33$$

$$\left(\frac{I^{\pi}_{4.967}}{I^{\pi}_{5.022}} = \frac{2^{+}}{2^{+}} \right)$$

$$P = 1.14 \pm 0.17$$

$$P = 0.86 \pm 0.11$$

Too high !

$$\left(\frac{I^{\pi}_{4.967}}{I^{\pi}_{5.022}} = \frac{1^{+}}{1^{+}} \right)$$

$$A_{5.022} = -1.0$$

$$A_{4.967} = -1.0$$

$$P = 0.38 \pm 0.06$$

$$P = 0.29 \pm 0.04$$

Spins and Parities of the 4.967, 5.022 MeV levels

$$I^{\pi}_{4.967} = 1^{+}, I^{\pi}_{5.022} = 1^{+}$$

4. results

(2) Revised decay scheme of ^{30}Na

**New findings
are in red.**

**14 γ rays &
4 energy levels
Spins & parities
of 10 levels**

**We can
confirm I^π
for 5 levels.**

5. discussion 1

(1) candidate of the intruder states : level at 1.788 MeV

intruder $^{2+}$ ^{30}Na g.s.

1.788 MeV (0^+) :
large β -decay intensity,
even though
secondary forbidden

*previously reported
to be $I_\beta \sim 0\%$*

$\xrightarrow{1.2\%, 6.8}$
 $\xrightarrow{5\%, 6.3}$
 $I_\beta, \log ft$

**Level at 1.788 MeV is expected
to have the intruder component .**

^{30}Mg
partial level scheme

5. discussion 1

(2) candidate of the intruder states :

levels at 4.967 and 5.414 MeV

intruder $\xrightarrow{2+}$ ^{30}Na g.s.

Large branching
ratio of β decay

$\xrightarrow{10.5\%, 5.25}$

$\xrightarrow{21.4\%, 5.02}$

Level at 1.788 MeV
is populated
by γ rays from
these 2 levels.

$\xrightarrow{1.2\%, 6.8}$
 $\xrightarrow{5\%, 6.3}$
 $I_\beta, \log ft$

partial level scheme

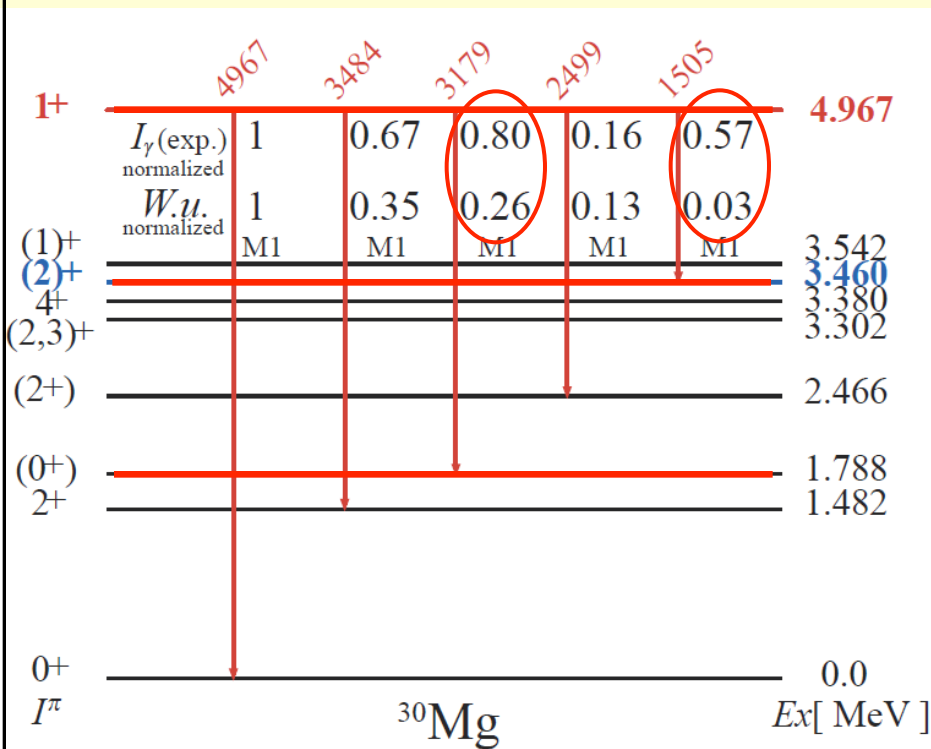

Levels at 4.967 and 5.414 MeV
are expected to have
the intruder component .

5. discussion 1

(3) candidate of the intruder states : level at 3.460 MeV

Branching ratios of γ -rays

Enhancement compared with Weisskopf estimate

Levels at 5.414 MeV[2^+], 4.967 MeV[1^+], 3.460 MeV[(2^+)] and 1.788 MeV[(0^+)] are expected to have mainly intruder component.

5. discussion 1

(4) What kind of level at 2.466 MeV ?

intruder 2^+ ^{30}Na g.s.

To the level at 2.466 MeV,
no or very small β -decay
branching ratio.

2^+ in ^{30}Na \longrightarrow 2^+ in ^{30}Mg

previously reported
to be $I_\beta \sim 6\%$

I_β , logft

$< 0.5\%$, > 7.4

many new γ rays
were observed.

Level at 2.466 MeV (2_2^+) maybe have
different nuclear structure
from the levels
at 2^+ in ^{30}Na (intruder) and
at 1.482 MeV 2_1^+ in ^{30}Mg (normal).

5. discussion 1 (5) summary

Different structures in ^{30}Mg

^{30}Na g.s. $2+$

partial level scheme

Level at 2.466 MeV $[(2^+)]$: 2^+ in Gamma-band ?

Summary of the nuclear structure in ^{30}Mg

Summary

- ◆ We have successfully revised the level scheme of ^{30}Mg in β -decay spectroscopy of spin-polarized ^{30}Na .
- ◆ 4 levels and 14 γ -rays were newly observed.
Spins and parities of 5 levels have been firmly assigned.
Those of 5 other levels have been reasonably proposed.
- ◆ The observed β - and γ -transition paths and intensities strongly suggest that the four levels of
(0^+)(1.788 MeV), (2^+)(3.460), 1^+ (4.967), and 2^+ (5.414)
have large components of intruder configuration
and one level of (2^+) (2.466 MeV)
is expected to be one of members in γ -band.

□ Generalized Bohr-Mottelson collective Hamiltonian

recent review: Próchniak and Rohoziński, J. Phys. G **36** 123101 (2009)

$$\mathcal{H}_{\text{coll}} = V(\beta, \gamma) + T_{\text{vib}} + T_{\text{rot}}$$

$$T_{\text{vib}} = \frac{1}{2} D_{\beta\beta}(\beta, \gamma) \dot{\beta}^2 + D_{\beta\gamma}(\beta, \gamma) \dot{\beta} \dot{\gamma} + \frac{1}{2} D_{\gamma\gamma}(\beta, \gamma) \dot{\gamma}^2$$

$$T_{\text{rot}} = \frac{1}{2} \sum_{k=1}^3 \mathcal{J}_k(\beta, \gamma) \omega_k^2$$

$V(\beta, \gamma)$

collective potential

$D(\beta, \gamma)$

vibrational collective mass

$J(\beta, \gamma)$

rotational moment of inertia

Microscopic derivations of functions in collective Hamiltonian

CHFB+LQRPA method

NH et al., Phys. Rev. C **82**, 064313 (2010)

Constrained Hartree-Fock-Bogoliubov equation

$V(\beta, \gamma)$

Local QRPA equations for vibration

$D(\beta, \gamma)$

Local QRPA equations for rotation

$J(\beta, \gamma)$

- QRPA on top of CHFB state
- solved at each point in (β, γ) plane
- Hamiltonian used in QRPA also contains constraint terms
- derived from adiabatic self-consistent collective coordinate method
(a successful version of ATDHFB theory) Matsuo et al., Prog.Theor.Phys. **103**, 959 (2000)

pumping the **two ground-state hyperfine levels** in order to achieve high polarization

without hyperfine int.

Polarized beam line at TRIUMF

Commissioned in 2001

Two hyperfine levels are pumped
Matching with the broad absorption line width

polarization achieved so far

^8Li : 80%, ^9Li : 56%, ^{11}Li : 55%,

^{20}Na : 57%, ^{21}Na : 56%, ^{26}Na : 55%,
 ^{27}Na : 51%, ^{28}Na : 45%

Pumping for $^{11}\text{Be}^+$ beam is in progress.

Alkali RI beam from ISOL
 A^{+1} beam at 10 – 60 keV

neutralizer

charge exchange in a Na vapor jet

optical pumping

for fast neutral beam in collinear geometry

two laser beams to pump the two ground-state hyperfine levels
longitudinal polarization

re-ionizer

collision with a cold He gas target (12K)

bend

transversely
nuclear-polarized
ion beam

TRIUMF ISAC

Isotope Separator / ACcelerator

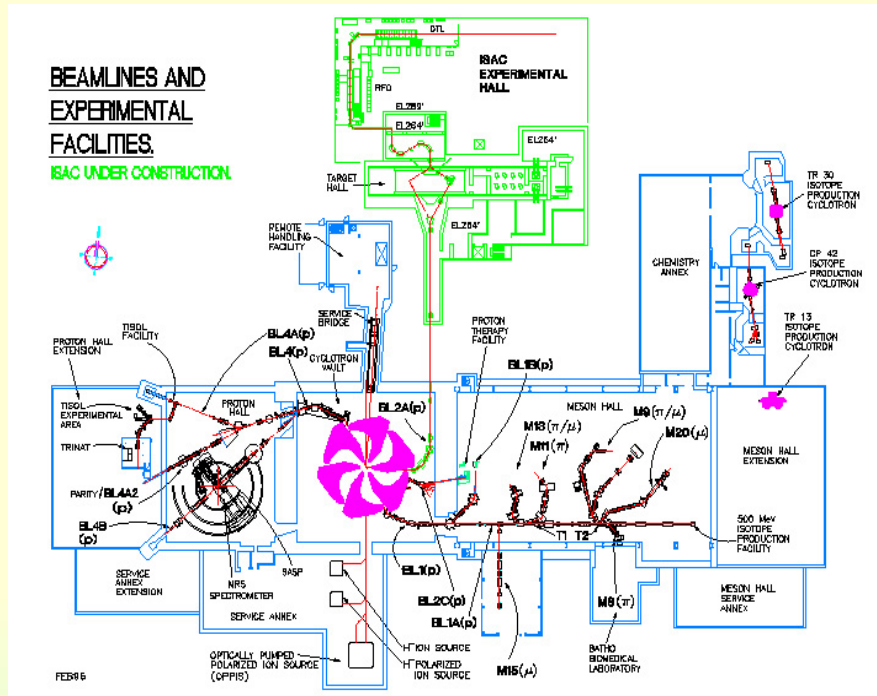

radioactive nuclear beams produced by 500 MeV 100 μ A proton beam

ISAC-I: $A \leq 30$, 1.5 MeV/u (construction: 1995 - 2000)

ISAC-II: $A \leq 150$, 6.5 MeV/u (construction: 2000 - 2005)

ISAC-I

ISAC at TRIUMF

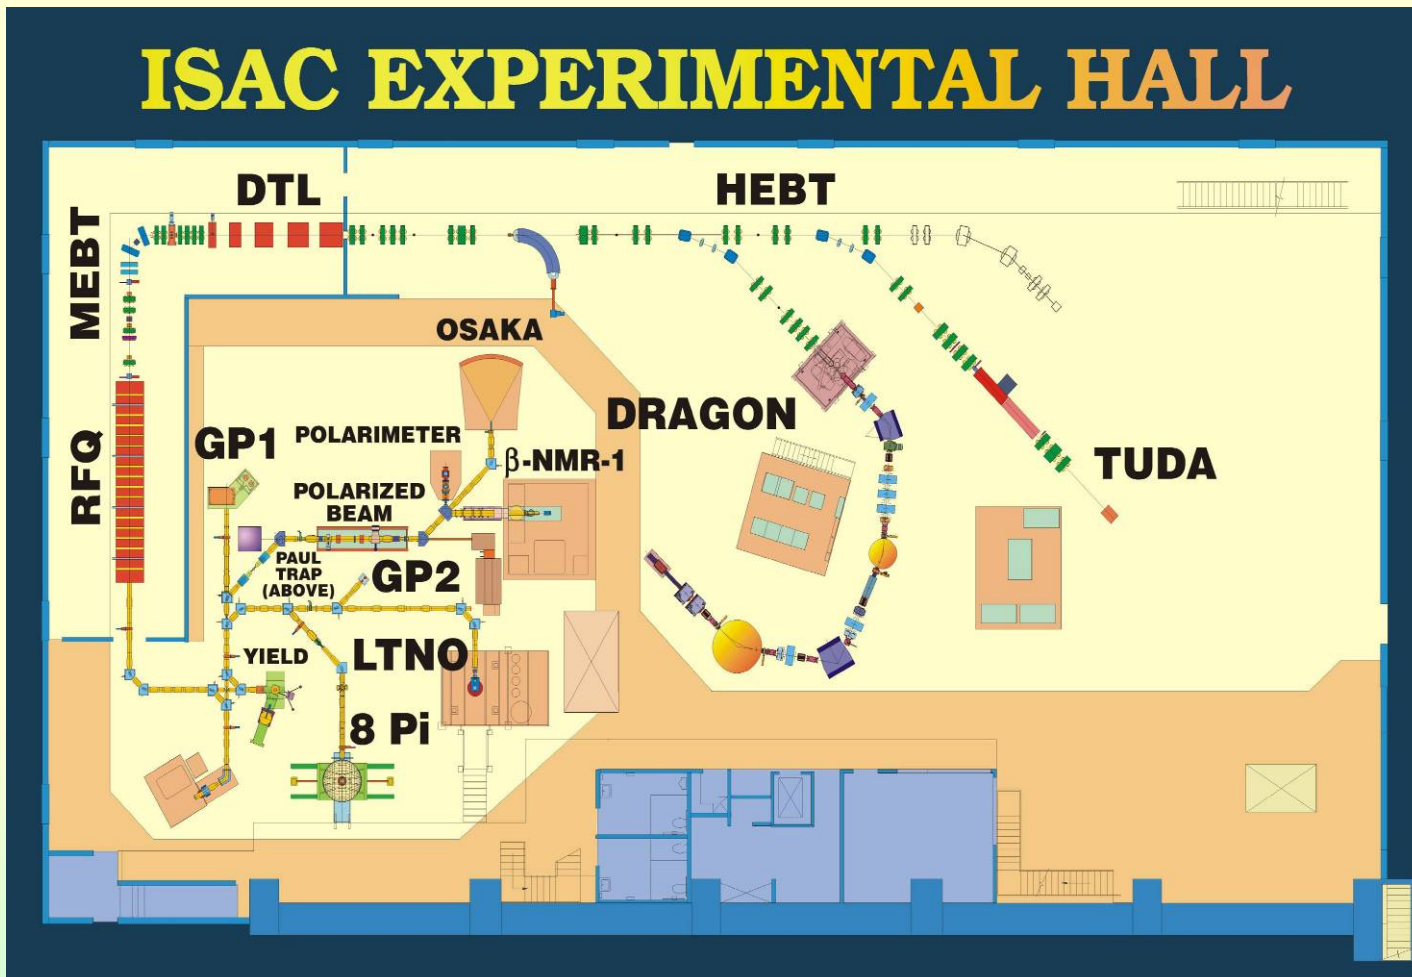

H⁺-acceleration, extraction to 3 ports simultaneously
In operation since 1974

TRIUMF ISAC-I Experimental Hall

low energy beam line: Polarized beam, Osaka, β -NMR, LTNO (Low Temperature Nuclear Orientation), 8Pi (Gamma ball), GP (General Purpose)

high energy beam line: DRAGON (nuclear astrophysics), TUDA (TRIUMF-U.K. Detector Array)

under ground level: TRINAT (TRIUMF Neutral Atom Trap), Lasers for polarized beam line

TRIUMF ISAC Polarized Beam Line

Polarized
beam line

laser system

Electro-Optic Modulator (EOM)

driven at the hyperfine splitting frequency

Only 1/3 laser power is used for each optical pumping.

broadening the laser line width

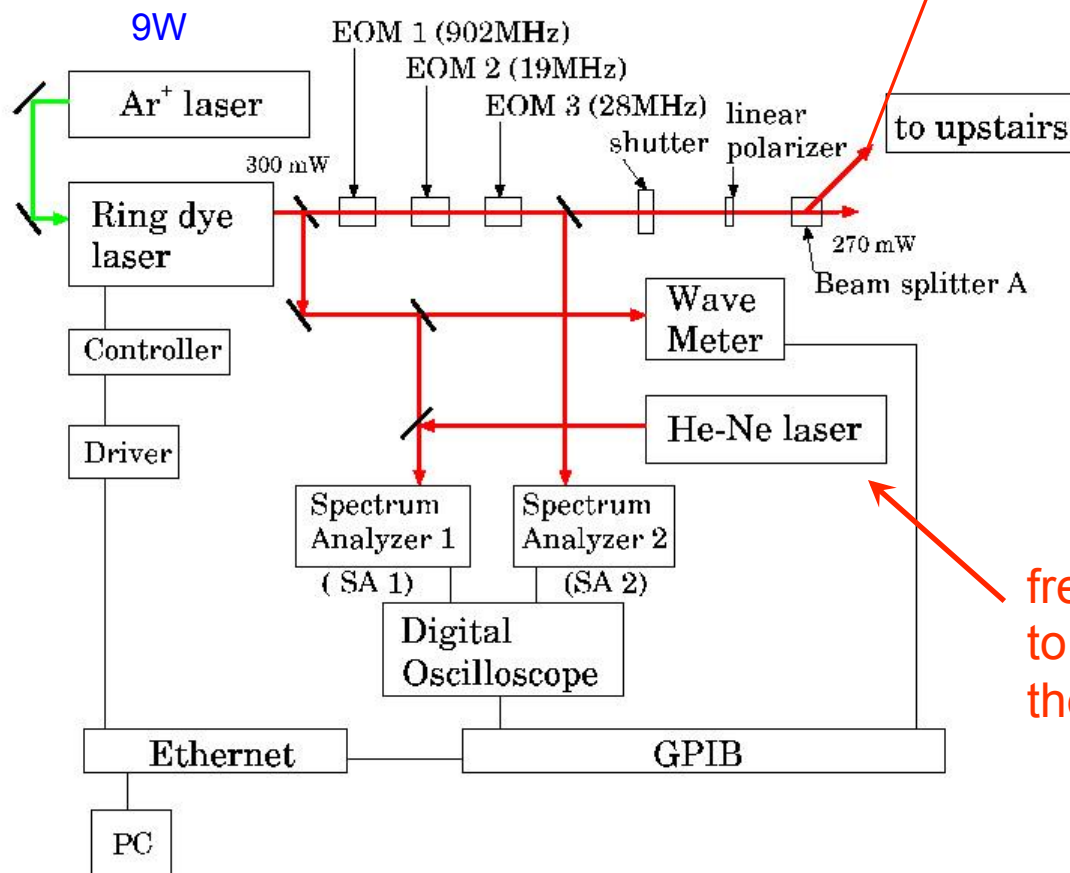

two EOMs in series

^8Li
 $P \sim 20\%$
 \downarrow
 $P \sim 70\%$

Laser system

Ring dye laser
Coherent 899-21
Dye: DCM SPECIAL/LC 6501

673 nm cw
circular polarized
for ¹¹Li

frequency reference
to actively stabilize
the ring dye laser

Doppler-shift tuning

deceleration bias (Na vapor cell)
tuning to adjust ion beam velocity
so as to meet the Doppler shift

absorption line

scanning velocity

beta-decay asymmetry

In the case of cascade feeding

Deduced A from β - γ coincidence is affected by the feeding from upper levels.

measured from β - γ_1 coincidence

$$A_1^\gamma = A_2 \times \frac{I_{\gamma_3}}{I_{\gamma_1}} + A_1 \times \frac{I_{\beta_1}}{I_{\gamma_1}},$$

known unknown

$$A_1 = A_1^\gamma \times \frac{I_{\gamma_1}}{I_{\beta_1}} - A_2 \times \frac{I_{\gamma_3}}{I_{\beta_1}}.$$
